2008 XE

EE24BTECH11020 - Ellanti Rohith

1) The solution of the first-order differential equation $(0 \le x < 1)$

$$\frac{dy}{dx} - y^2 = 0$$
, $y(0) = 1$ is:

[GATE 2008]

a) $\frac{1}{1+x}$

b) $\frac{1}{1-x}$

c) $\frac{2}{2+x}$

d) $\frac{x^3}{3} + 1$

2) For the initial value problem

$$\frac{dy}{dx} + y = 0, \ y(0) = 1,$$

 y_1 is the computed value of y at x = 0.2 obtained by using Euler's method with step size h = 0.1. Then, [GATE 2008]

a) $y_1 < e^{-0.2}$ b) $e^{-0.2} < y_1 < 1$

c) $1 < y_1$ d) $y_1 = e^{-0.2}$

3) Consider the initial value problem

$$\frac{dy}{dx} = y + x, \ y(0) = 2 \ .$$

The value of y_1 obtained using the fourth order Runge-Kutta method with step size h = 0.1 is [GATE 2008]

a) 2.20000

b) 2.21500

c) 2.21551

d) 2.21576

4) The following table gives a function f(x) vs x:

х	0	1	2	3	4
f(x)	1.0	3.7	6.5	9.3	12.1

The best fit of a straight line for the above data points, using a least square error method is:

[GATE 2008]

a) 2.75x + 0.55

b) 2.80x + 0.80

c) 3.10x + 0.85

d) 2.78x + 0.96

5) Consider the following part of a Fortran 90 function:

INTEGER FUNCTION RESULT(X)

RESULT = VALUE END FUNCTION RESULT

If the above function is called with an integer X = 123, the value returned by the function will be: [GATE 2008]

a) 0

b) 6

c) 9

d) 321

6) A portion of a Fortran 90 program is reproduced below:

PROGRAM CHECK_CYCLE

DO I = 1, 10, 2

IF (MOD(I, 3) == 0) CYCLE

PRINT *, I

END DO

END PROGRAM CHECK_CYCLE

The result displayed by the program is:

[GATE 2008]

d) 357

7) (P), (Q), (R) and (S) are separate segments of Fortran 90 code.

(P) IF (A > B) P = Q

(Q) SUBROUTINE SWAP(A, B)

INTEGER, INTENT(IN) :: A, B

TEMP = A

A = B

B = TEMP

END SUBROUTINE SWAP

(R) IF (A /= B) X = Y - Z ELSE X = Y + Z ENDIF

(S) DO I = 1, N, 3 C(I) = A(I) + B(I)END DO

Which segments have syntax errors?

[GATE 2008]

a) P, Q

b) Q, R

c) R, S

d) P, S

8) A Fortran-90 subroutine for the Gauss-Seidel Method to solve a set of N simultaneous equations [A][X] = [C] is given below:

SUBROUTINE SIEDEL(A, C, X, N, IMAX)

REAL :: SUM

REAL, DIMENSION(N,N) :: A REAL, DIMENSION(N) :: C, X

DO K = 1, IMAX

```
DO I = 1, N
                  SUM = 0.0
                  DO J = 1, N
                       IF (I /= J) THEN
                            SUM = SUM + A(I,J)*X(J)
                       ENDIF
                  ENDDO
                  *****
             ENDDO
        ENDDO
        END SUBROUTINE SIEDEL
    The missing statement in the program, indicated by '*****, is:
                                                                                     [GATE 2008]
   a) X(I) = C(I) + SUM b) X(I) = C(I) - SUM c) X(I) = \frac{C(I) + SUM}{A(I,I)}
                                                                          d) X(I) = \frac{C(I) - SUM}{A(I,I)}
 9) What is the result of the following C program?
        int main()
             int i, sum=0;
             for (i = 0; i < 25; i++) {
                  if (i > 10) continue;
                  sum += i;
             }
             printf("%d\n", sum);
             return 1;
                                                                                     [GATE 2008]
                           b) 45
                                                                           d) 325
                                                   c) 55
10) Consider the following C code:
        int x = 1, y = 5, z;
        z = x++<<--y;
    The values of x, y, and z after the execution are:
                                                                                     [GATE 2008]
   a) 2, 4, 16
                           b) 2, 4, 32
                                                   c) 2, 4, 64
                                                                           d) 1, 5, 32
```

11) A two-dimensional array is declared as int num[3][3]. Then the result of the expression *(num+1) [GATE 2008] is:

- a) The value of num[1][0]
- b) The value of num[0][1]

{

}

a) 25

- c) The address of num[1][0]
- d) The address of num[0][1]
- 12) A C function named func is defined as follows:

```
int func(int a, int b)
   if ( (a == 1)||(b == 0)||(a == b)) return 1;
   return func(a-1,b) + func(a-1,b-1);
}
```

What is the result of func(4, 2)?

[GATE 2008]

	Common Data for Questions 29 and 30 The following table gives the values of a function $f(x)$ at three discrete points.								
	X	0.5	0.6	0.7					
	f(x)	0.4794	0.5646	0.6442					
					[GATE 2008]				
13) The value of $f'($	(x) at $x = 0.5$ accurate up	p to two	decimal	places, i	S				
a) 0.82	b) 0.85		c) 0.88	3	d) 0.91				
14) The value of $f(x)$ at $x = 0.55$ obtained using Newton's interpolation formula, is									
a) 0.5626	b) 0.5227		c) 0.48	347	d) 0.4749				
Linked Answer Questions: Q.31 to Q.34 carry two marks each. A modified Newton-Raphson method is used to find the roots of an equation $f(x) = 0$ which has multiple zeros at some point $x = p$ in the interval $[a, b]$. If the multiplicity M of the root is known in advance, an iterative procedure for determining p_{k+1} is given by									
$p_{k+1} = p_k - M \frac{f(p_k)}{f'(p_k)}$ for $k = 0, 1, 2,$									

c) 3

[GATE 2008]

15) The equation $f(x) = x^3 - 1.8x^2 - 1.35x + 2.7 = 0$ is known to have a multiple root in the interval [1, 2]. Starting with an initial guess $x_0 = 1.0$ in the modified Newton-Raphson method, the root, correct up to three decimal places, is

a) 1.500

a) 12

b) 1.200

b) 6

c) 1.578

d) 1.495

d) 1

16) The root of the derivative of f(x) in the same interval is

a) 1.500

b) 1.200

- c) 1.578
- d) 1.495

Statement for Linked Answer Questions 33 and 34:

The values of a function f(x) at four discrete points are as follows:

	x	0	1	3	4
f	(x)	-12	0	6	12

17) The function may be represented by a polynomial P(x) = (x - a)R(x), where R(x) is a polynomial of degree 2, obtained by Lagrange's interpolation and a is a real constant. The polynomial R(x) is

a)
$$x^2 + 6x + 12$$

b)
$$x^2 + 6x - 12$$
 c) $x^2 - 6x - 12$ d) $x^2 - 6x + 12$

c)
$$x^2 - 6x - 12$$

d)
$$x^2 - 6x + 12$$
